Session 08

System Isolation

Security of Information Systems (SIS)

Computer Science and Engineering Department

November 22, 2023

Notes

Papers

- Application and analysis of the virtual machine approach to information system security and isolation
- My VM is Lighter (and Safer) than your Container

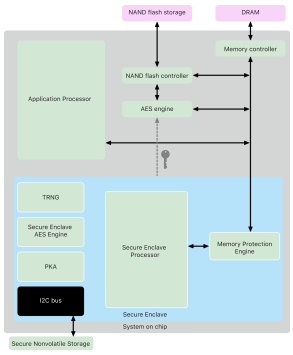
Notes

Apple FaceID, TouchID, SEP

- Application Processor (AP) vs Secure Enclave Processor (SEP)
- *Secure Enclave* - similar to ARM TrustZone
- hardware-based isolation
- biometrics, keys are only handled by SEP
- specific interface between AP and SEP

Notes

Apple SEP (2)



https://support.apple.com/en-ke/guide/security/sec59b0b31ff/web

Notes

Run Untrusted Code

- apps, plugins, codecs
- software not written by you, not-verified
- damage control
- kill it if it misbehaves
- ensure misbehaving app does not alter the system

Notes

Confinement Types

- hardware: different hardware systems, air gap
- virtual machine: isolate OSes in a single machine
- process: sandboxing, jailing
- application: software fault isolation

Notes

Software Fault Isolation

- isolate components in their *fault domain*
- part of the same address space
- requires some OS/hardware support to separate addresses
- Mogoșanu et al.: MicroStache: A Lightweight Execution Context for In-Process Safe Region Isolation

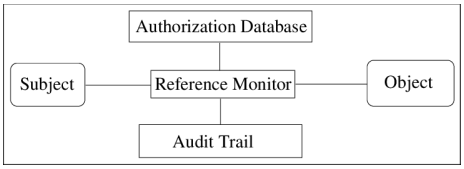
Notes

Reference Monitor

- mediates requests, implements policy, enforces isolation and confinement
- must always be invoked
- tamperproof
- validated

Notes

Reference Monitor (2)



https://www.researchgate.net/publication/2390175_Secure_Information_Flow_in_Mobile_Bootstrapping_Process

Notes

Principles and Goals

- least privilege
- privilege separation
- safely execute a non-trusted program
- harden a system that runs programs that increase its attack surface
- isolate what can happen if a vulnerability is exploited

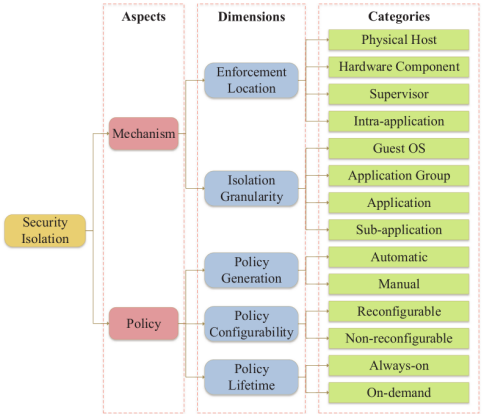
Notes

Mechanism and Policy

- mechanism: how goals are achieved
- policy: rules that achieve isolation goals
- mechanism: mostly implementation
- policy: mostly configuration

Notes

Mechanisms and Policies



Rui Shu et al.: A Study of Security Isolation Techniques

Notes

System Isolation

- isolate app, group apps or entire OS
- prevent it from hurting other components
- virtual machines, library OS, containers
- we consider sandboxing, mandatory access control, software fault isolation (SFI) to be app-centric mechanisms (not system-centric)

Notes

Trusted Computing Base (TCB)

- trusted system components (by the reference monitor)
- critical parts of the system
- if exploited, might jeopardize the security of the entire system
- aimed to be small (reduced attack surface)

Notes

Hardware Protection

- provide security isolation for shared resources
- passive components: TPM (*Trusted Platform Module*)
- active components: control critical system operations

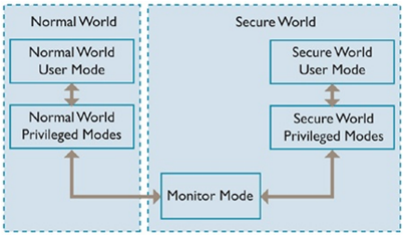
Notes

Trusted Execution Environment (TEE)

- secure area on CPU
- code run is secure: confidentiality and integrity
- runs in parallel with OS

Notes

TEE (2)



https://resources.infosecinstitute.com/topic/understanding-ios-security-part-1/

Notes

Intel TXT

- Trusted eXecution Technology
- attest platform/operating system
- uses TPM and cryptography to validate/measure code that can be trusted

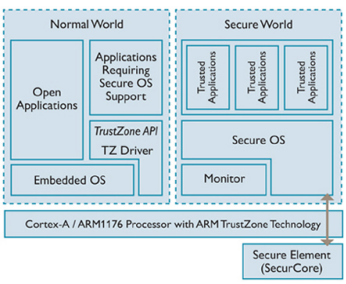
Notes

ARM TrustZone

- ARM TZ
- two worlds: secure and non-secure
- rich OS runs in non-secure worlds, security-specialized code in secure world
- aim to reduce attack surface

Notes

ARM TrustZone



https://blog.quarkslab.com/introduction-to-trusted-execution-environment-arms-trustzone.html

Notes

Intel SGX

- Software Guard eXtensions
- specialized instructions
- user-level code allocates enclaves
- protected from higher privilege level components
- secure remote computation
- cache DRAM side-channel attack

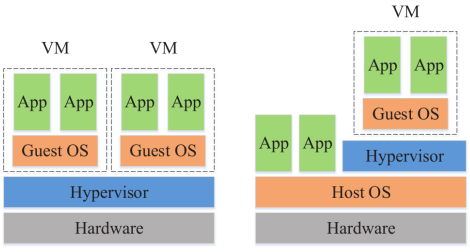
Notes

Secure Enclave

- on Apple iOS / watchOS devices
- fingerprint data completely walled from the OS
- uses a SEP (*Secure Enclave Processor*), SEP OS
- based on ARM TZ

Notes

Virtualization



(a) Type-1 Hypervisor (b) Type-2 Hypervisor

Rui Shu et al.: A Study of Security Isolation Techniques

Notes

Virtual Machine

- run an isolated OS instance on top of a supervisor component (hypervisor)
- hypervisor or VMM (*Virtual Machine Monitor*)
- malware in a VM cannot infect host OS or other VMs

Notes

Covert Channels

- side channels
- use CPU, memory, cache information from one VM to determine what's happening on the other VM

Notes

VMM Detection

- VM platforms emulate simple hardware
- VMM introduces time latency variances
- VMM shares TLB (*Translation Lookaside Buffers*)

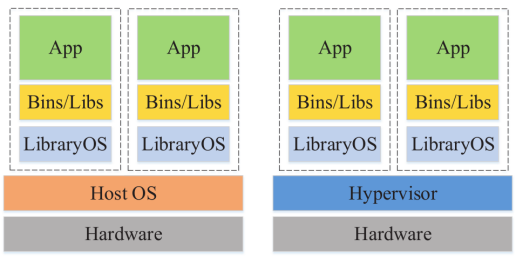
Notes

Type-1 vs Type-2

- reduced TCB vs additional flexibility
- efficiency for Type-1

Notes

Library OS



(a) LibraryOS on Host OS (b) LibraryOS on Hypervisor

Rui Shu et al.: A Study of Security Isolation Techniques

Notes

Library OS Characteristics

- unikernel
- OS functionality as user library/libraries
- single-image app, can run on top of hypervisor or hardware
- no need for user-level/kernel-level transitions
- difficult to run multiple instances: use a hypervisor
- reduce the attack surface

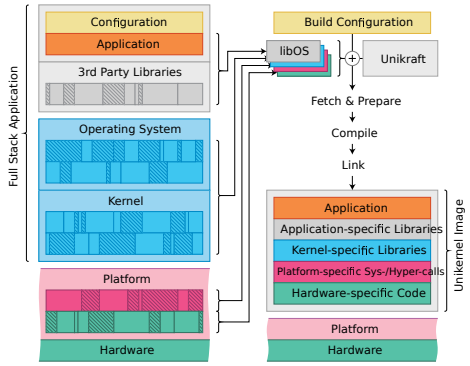
Notes

Implementations

- ClickOS: virtualized software middle box
- LKL (*Linux Kernel Library*)
- My VM is Lighter (and Safer) than Your Container: `http://cnp.neclab.eu/projects/lightvm/lightvm.pdf`
- `https://awesomeopensource.com/projects/unikernel`

Notes

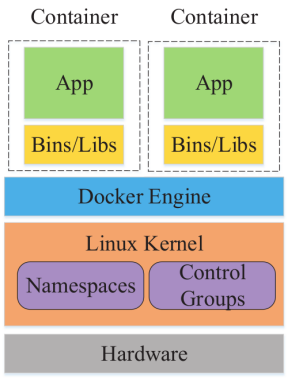
Unikraft



`https://unikraft.org/docs/concepts/build-process/`

Notes

Containers



Rui Shu et al.: A Study of Security Isolation Techniques

Notes

Container

- restricted environment
- applications or application groups
- sandboxing only provides a certain set of privileges
- containers provide a dedicated isolated environment

Notes

LXC/Docker

- Linux Containers
- use Linux namespaces: PID, network, IPC, mount, user, UTS
- Linux control groups (cgroups): limits, accounts, isolates resource usage

Notes

OS vs. Application Containers

- OS: provided an entire distro, similar to a virtual machine (LXC)
- app: provide an environment for running a single service (Docker)

Notes

Containers vs. hypervisors

- containers are faster to create, deploy, run
- containers are lighter (reduced overhead)
- hypervisors are more secure: reduced TCB, no common kernel

Notes

Keywords

- confinement
- isolation
- resource monitor
- TCB
- TEE
- Intel TXT
- Intel SGX
- ARM TZ
- VMM
- hypervisor
- library OS
- unikernel
- container
- LXC
- Docker
